

Helping an International Product Company Build Its U.S. Growth Infrastructure

The Challenge

An established international product company was expanding into the United States but faced a very different operating environment from its home market.

The company needed to understand the U.S. market while simultaneously addressing several operational challenges:

- Limited familiarity with the U.S. competitive landscape
- Product shipping and distribution challenges
- Training that depended heavily on one individual within the company
- An underdeveloped sales process for the U.S. market
- The need for stronger brand awareness and market exposure
- An unexpected tariff increase affecting products manufactured overseas

The company did not simply need more marketing. It needed the infrastructure to support sustainable U.S. growth.

The Genysis IQ Approach

Genysis IQ worked directly with the company's co-founders and leadership team to address the business from multiple angles.

U.S. Market Analysis & Strategy

Genysis IQ provided market consultation and competitive analysis to help leadership better understand U.S. customer expectations, pricing, positioning and growth opportunities.

Training Systems & Academy Development

Training had become overly dependent on one key person within the organization. Genysis IQ worked with the founders to structure the company's knowledge into a repeatable training system and helped develop a dedicated training academy.

The goal was to transform institutional knowledge into a scalable platform that could support employees, sales professionals, educators and other participants without requiring the same person to repeatedly deliver every aspect of the training.

Sales Systems & Processes

Genysis IQ evaluated the sales cycle and recommended systems, processes and technology designed to create greater consistency, improve follow-up and make the sales process easier to manage and replicate.

Domestic Manufacturing Strategy

When an unexpected tariff increase significantly affected the economics of importing products from the

company's existing manufacturing country, Genysis IQ evaluated alternatives and identified a U.S. manufacturing partner capable of supporting domestic production.

Moving production to the United States created a potential path to reduce tariff exposure, simplify logistics and strengthen the company's long-term U.S. supply-chain strategy.

Brand Awareness & Media Outreach

To support market expansion, Genysis IQ also developed targeted media outreach opportunities, including identifying and engaging:

- Podcast hosts
- Magazine editors
- Radio programs
- Other potential interview and brand-exposure channels

This strategy was designed to build credibility and awareness through third-party media rather than relying exclusively on paid advertising.

The Result

The engagement helped move the company from a collection of disconnected growth challenges toward a more structured U.S. operating model.

Genysis IQ helped the company establish:

- A clearer U.S. market strategy
- A structured and scalable training platform
- A dedicated training academy
- More repeatable sales systems and processes
- A domestic manufacturing option to mitigate tariff exposure
- A broader media and brand-awareness strategy
- Reduced dependence on individual people for critical business functions

The CASPER Connection

This engagement demonstrates how scaling problems are rarely isolated.

Clarity — Understanding the U.S. market, competitive environment and growth priorities.

Architecture — Determining how training, sales, manufacturing and marketing should support expansion.

Systems — Developing technology-supported training and sales infrastructure.

Processes — Creating repeatable methods for training, follow-up and market development.

Evaluation — Responding to changing economics, including tariffs and supply-chain risk.

Replication — Converting founder and employee knowledge into systems capable of supporting continued growth.

The Takeaway

Entering a new market requires more than selling more products. Sustainable expansion requires the systems, processes, training, supply chain and market strategy capable of supporting the growth that follows.
